

Smipack is glad to present a new option for the side sealers from the FP range.

The air puff placed before the entrance of the side sealer allows you to enter more air in the bag in order to create a better "balloon effect" during the shrinking process and stretch the film at the best to avoid wrinkles on the packages thus getting an optimal esthetic result.

This option is highly recommended if you want to wrap long and low products.

For further technical info and price requests please contact our sales office.

Best regards
