

Since several months Smipack has already introduced on the market two new infeed solutions for its range of L-sealers and side-sealers.

The GHR 280R system allows to receive rigid products directly from the customer's line not cadenced and to separate them, group them in different rows but on one layer only and by means of a motorized pusher controlled by inverter and encoder, move them onto the inlet conveyor of our automatic L-sealers.

The GHR 280ST model allows to receive rigid products directly from the customer's line not cadenced and to separate them, group them in different rows and multiple layers and, by means of a motorized pusher controlled by inverter and encoder, move them onto the inlet conveyor of our automatic L-sealers.

Since the production capacity of these conveyors does not exceed 20ppm, this makes them particularly suitable as optionals of the automatic L-sealers already sufficient to support these speeds, even if they are anyway matchable with the side sealers.

To check the operation of the a.m.optionals please see the following links: [GHR 280R](#) and [GHR 280ST](#).

The prices of the infeed conveyors are already included in 2015 price list among the optionals of automatic L-sealers. For further info please contact our sales office.

Best regards
