

This new optional consists of:

- kit for short and light packs;
- device for the dragging of the film on the upper unwinder controlled by inverter.

It can be provided only on machines of new production and not for already installed ones and only for BP800AS, BP802AS, BP1102AS models.

This is a solution particularly suitable for light, short and stacked products that, only with the lower system, and already available since long time, were not workable with the models of the BP AS range.

This optional can be enabled/disabled from the control panel where you can also adjust the speed of the upper roller, thus increasing the provision of film to facilitate the passage of the product over the sealing bar.

In this [link](#) you will find the video where you can see the operation of this optional.

Best regards
